

AVP

A Secure Asset Valuation Platform for Utility Network Operators

The Asset Value Portal (AVP) is a secure, cloud-hosted platform designed to digitise and modernise the asset valuation process for Independent Distribution Network Operators (IDNOs), Independent Gas Transporters (IGTs), and adopting utility organisations.

AVP provides a complete, end-to-end solution for managing asset value quotations, customer interactions, and approval workflows with full auditability and operational control. By replacing fragmented manual processes with a guided, user-friendly interface, the platform enables utility operators to deliver faster, more accurate and fully governed asset valuation and adoption processes.

Designed to support both single-utility and multi-utility environments, AVP provides a trusted and scalable foundation for managing portfolio growth and improving operational efficiency.

Comprehensive Quotation and Asset Valuation Management

AVP enables Independent Connection Providers (ICPs), Utility Infrastructure Providers (UIPs), and utility operators to create, manage and track asset value quotations through a structured and controlled workflow.

Core capabilities include:

- Guided quote creation through a configurable Quote Wizard
- Management of developments, project data and customer records
- Configurable approval workflows and tariff structures
- Real-time quote tracking, status updates and automated notifications
- Automatic generation of formal quotation documents and outputs

These capabilities ensure complete transparency, auditability and control across the asset adoption process.

Flexible Calculation Engine and Operational Integration

AVP incorporates a flexible calculation engine framework that integrates securely with customer-owned valuation models. Using secure Microsoft Graph integration, the platform connects to customer-managed Excel calculation workbooks, enabling automated valuation calculations while preserving full transparency and control.

This approach enables:

- Automated asset valuation calculation and quote generation
- Version-controlled tariff and pricing models
- Secure and traceable calculation execution
- Full ownership and governance of valuation methodologies

The platform integrates seamlessly into existing operational environments and supports future integration with wider utility systems.

Secure Infrastructure, Compliance and Operational Control

AVP is hosted within ISO27001-certified UK data centres, providing secure, resilient and fully managed infrastructure.

Key features include:

- Role-based access control and secure user management
- Full audit trail of all system activity and quotation changes
- Centralised reporting and data export capabilities
- Customer, tariff and regulatory reference data management
- Comprehensive dashboards and operational reporting

This ensures organisations can operate efficiently while maintaining regulatory compliance and data integrity.

AVP

Purpose-Built for Utility Network Operators

Used by IDNOs, IGTs and adopting utility organisations, AVP provides a secure, configurable platform that streamlines asset valuation, improves customer experience and supports business growth.

By transforming asset valuation into a controlled, automated and transparent process, AVP enables utility operators to operate efficiently, professionally and with full confidence in their quotation and asset adoption processes.
